# FAKE NEWS FILTER

A PLACE TO CHECK FAKE NEWS OF COVID

PROBLEM WE HAVE SOLVED

Currently, our country is facing a deadly COVID-19 pandemic. Under any pandemic situation the people are sreading fake news. And due these spreads of fake news a panic situation has been created so that it will be difficult for government to overcome from pandemic. And currently there are lots of fake news are spreading all over the internet. So, we need a solution that can check any spread of fake news or if it is not possible that at least people by their own can check any news or filter it.

OUR IDEA

Our idea is to develop an online platform like a filter. If someone got any news then they can check that news weather it is fake or real, by just copying that news into that filter and filter will tell that news is fake or real. We will also put all the news updates about this COVID-19 pandemic. And rather making too many platforms for news and updates we need to keep only one platform for this pandemic. Making different platform for this pandemic gives so much confusion to the people.

TECHNOLOGIES USED

To make this filter we will use latest technologies like,

- Python

- Machine Learning

- Django

- Cloud Computing

WHAT WE NEED?

- We need a cloud space for deploying of this application.

- A domain name server (DOMAIN) for this application.

- Some fund for digital marketing.

THANK YOU

First we plan what to do, then we think how to do? Because we don't know how to do it but we will do it.
